

Plateful — Pre-Launch Test Checklist

Build 1.0.5 (versionCode 8) · targets Android 16 (API 36) · Firebase + Deno backend

Test on a real device installed from Play internal testing — not a sideloaded APK. Payments and Google Sign-In both depend on the Play app-signing key, so a sideloaded build cannot prove either one works. Upload to internal testing, install from the opt-in link, then work through this list. Promote to production only when the CRITICAL sections pass.

0 · Before you start

- ☐ Build 8 uploaded to Play **internal testing** and installed from the test link
- ☐ Your Google account added under Play Console → Setup → **License testing**
Gives free test purchases instead of real charges.
- ☐ A 7-day free trial offer is **active** on the subscription base plan
Play Console → Monetize → Subscriptions → base plan → Add offer. The app advertises 7 days.
- ☐ A second Google account available, for testing a fresh signup
- ☐ Firestore rules deployed and Email/Password + Google enabled in Firebase Auth

A · Payments & subscription **NEVER TESTED**

- ☐ Paywall opens from onboarding “Start 7 day free trial”
- ☐ Paywall opens from Profile → Upgrade to Plateful Pro
- ☐ Prices render correctly — not blank, not \$0.00, not “test price” placeholders
As a license tester Play may show “per 5 minutes” — that is expected test acceleration.
- ☐ Free trial is offered on the plan that should have it
- ☐ Complete a test purchase — the payment sheet appears and completes
- ☐ Pro unlocks **immediately** after purchase
Tailor and Healthify should lose their padlocks without restarting.
- ☐ Close the app fully, reopen — still Pro
- ☐ Background the app ~30s, return — still Pro
Exercises the entitlement refresh on resume.
- ☐ Profile → Manage Subscription opens the Customer Center
- ☐ Restore Purchases returns Pro on a reinstall
- ☐ RevenueCat dashboard shows the transaction against the right user
- ☐ Cancel in Play → app returns to free once the entitlement expires
- ☐ Free user hits the paywall after 5 imports (6th is blocked)

B · Authentication **NEVER TESTED**

- ☐ Email signup creates an account and lands on Home
- ☐ Display name appears on the Home greeting (profile document created)
- ☐ Sign out returns to the welcome screen
- ☐ Email login works with the same credentials
- ☐ Wrong password shows a friendly message
Should read “Incorrect email or password”, never “[firebase_auth/...]”.

- ☐ **Google Sign-In on a brand-new account**
The one path never fully verified. Must be tested on the Play-signed build.
- ☐ Google Sign-In on an existing account
- ☐ Cancelling the Google picker shows no error
- ☐ Password reset email arrives and works
- ☐ Kill and relaunch the app — still signed in
- ☐ Delete Account removes the data and signs out

C • Recipe import

- ☐ Share a recipe from a browser (website link)
- ☐ Share from YouTube (regular video)
- ☐ Share from YouTube Shorts
- ☐ Share from TikTok
- ☐ Share from Instagram
- ☐ Cold start via share skips the splash and goes straight to importing
Force-stop the app first, then share — it should not show the logo screen.
- ☐ The thumbnail image is saved and visible on the Home card
Recently fixed for videos — worth checking on a YouTube import specifically.
- ☐ Cooking animation and progressing status messages appear
- ☐ Add a recipe manually
- ☐ Paste a link inside the app (Add → Extract Recipe)
- ☐ A dead link shows a sensible reason, not a login-wall message
Recently fixed — should say the page could not be found.

D • Recipes adapt to your diet NEW

- ☐ Set a diet in Profile (e.g. Gluten-Free)
- ☐ Import a recipe that conflicts with it (e.g. banana bread, pasta)
- ☐ The saved recipe arrives already adapted (title and ingredients)
- ☐ “Adapted for you” banner appears with a short summary
- ☐ Swapped ingredients are outlined and labelled “swapped for ...”
- ☐ “View original” switches back to the untouched recipe
- ☐ “View adapted” switches forward again
- ☐ A user with diet “None” and no allergies gets an **unadapted** recipe
- ☐ Adaptation failure never blocks the import (recipe still saves)

E • Recipes, favorites & collections

- ☐ Open a recipe from Home and from All Recipes
- ☐ Servings +/- rescales ingredient amounts
- ☐ Macros donut renders with three distinguishable colours
- ☐ The “?” beside Macros explains where the numbers come from
- ☐ Edit a recipe and confirm the change saves
- ☐ Delete a recipe

- ☐ Heart a recipe — it fills, persists after reopening, and shows on list cards
- ☐ Favorites appears first in Collections on Home
- ☐ Tapping Favorites on Home opens it
Recently fixed — previously no collection card opened.
- ☐ Tapping any other collection card on Home opens it
- ☐ Create a collection, add a recipe to it, remove the recipe
- ☐ Favorites has no delete button and cannot be removed
- ☐ Add to a collection from the import success screen

F • Pro features (with Pro active)

- ☐ Tailor generates substitutions for a recipe
- ☐ Healthify generates healthier swaps
- ☐ Meal plan → Generate Week produces a plan
- ☐ Pantry → “What can I cook?” returns suggestions
- ☐ Add to Grocery adds the ingredients
- ☐ Add to Plan places the recipe in a slot

G • Remaining screens

- ☐ Pantry: add and delete items
- ☐ Grocery: add, tick off and delete items
- ☐ Meal plan: add a recipe to a slot, move between weeks
- ☐ Profile: change diet, toggle dark mode, open notifications
- ☐ Dark mode looks correct on every main screen

H • Errors, offline & edge cases

- ☐ Airplane mode: importing shows a connection message, no crash
- ☐ Airplane mode: opening the app does not hang or crash
- ☐ No screen shows a raw error code or stack trace
- ☐ No user-facing text anywhere says “AI”
Copy was changed to “intelligent” / plain descriptions.
- ☐ Content is not clipped by the status bar or navigation bar
- ☐ Bottom navigation labels are readable on both light and dark
- ☐ Large system font size does not break layouts

I • Before promoting to production

- ☐ Rotate the DeepSeek API key and update it on the Deno function
The current value appeared in a chat transcript.
- ☐ Rotate the Firecrawl API key and update it on the Deno function
- ☐ Revoke the Deno Deploy access token and issue a fresh one
- ☐ Restrict the Firebase Android API key in Google Cloud
Restrict to the app package + SHA, and to only the APIs in use.
- ☐ Confirm both Play Console warnings have cleared (target API level, RevenueCat SDK)

-
- ☐ Release notes pasted into the Play listing
 - ☐ Promote the tested internal build to production (do not upload a new one)
-

Highest-risk items, in order: (1) a real purchase unlocking Pro, (2) Google Sign-In on the Play-signed build, (3) importing from each social platform you advertise. If you only have time for three tests, do those.
